

Catch::StringMaker
< char[SZ]>::convert

Catch::StringMaker
< signed char[SZ]>::
convert

Catch::StringMaker
< unsigned char[SZ]>
::convert

Catch::Detail::catch
_strlen

```
graph LR; A[Catch::StringMaker< char[SZ]>::convert] --> D[Catch::Detail::catch_strlen]; B[Catch::StringMaker< signed char[SZ]>::convert] --> D; C[Catch::StringMaker< unsigned char[SZ]>::convert] --> D;
```

The diagram illustrates the relationship between three different string maker templates and a common function. On the left, there are three white rectangular boxes, each containing a template specialization of `Catch::StringMaker`. The top box is for `< char[SZ]>`, the middle for `< signed char[SZ]>`, and the bottom for `< unsigned char[SZ]>`. All three have a `::convert` member function. Blue arrows point from the `convert` member of each template to a single gray rectangular box on the right. This box contains the text `Catch::Detail::catch_strlen`, indicating that all three `convert` functions delegate the work to this common function.
